

FIFA World Cup 2026 Fan Dashboard — A Demo for the AI-in-Finance Use Case

1. About this submission

This project is a public, non-sensitive demonstration of an AI-augmented, auto-refreshing dashboard. The same architecture and patterns would be applied to a real finance dashboard with confidential financial data — only the data layer and access controls would change. Please treat this as a working prototype of the **delivery pattern**, not the subject matter.

2. What the dashboard is

A single-page, self-contained HTML dashboard tracking the FIFA World Cup 2026. It covers schedule, live scores, group standings, knockout bracket, team comparison, AI insights, history, venues, and a fan zone.

Live URL: <https://salmon-forest-0054c2910.7.azurestaticapps.net/>

3. Data sources

- **GitHub** — [webmaster/world-cup-2026-schedule-data](#) (public GitHub JSON)
- **Open** — [openfootball/worldcup.json](#) (CC0 public schedule data)
- **Public** — FIFA.com and Wikipedia for official tournament info
- **Local** — locally curated fallback (`manual_fallbacks.json`) so the dashboard renders even if external sources fail
- **Internal** — for a finance use case these would be replaced by internal data warehouses, market-data feeds, or internal APIs

4. AI for insights

- **Elo-rating probability model** — every upcoming match shows win / draw / loss percentages computed from each team's Elo rating. The same idea would model risk, default likelihood, or trade-direction probability in a finance dashboard.
- **OpenAI GPT-4o LLM (llama-3.1-8b-instant)** generates a one-line natural-language narrative for each match. For finance, the same LLM pattern would generate plain-English commentary alongside numeric KPIs.

5. Player and country insights

- **Team Favourites** — top 8 teams ranked by Elo rating with strength bars; hover any team for a tooltip with World Cup titles, runner-up count, FIFA rank, last WC finish, and key player.
- **Stars to Watch** — marquee players (Messi, Mbappé, Bellingham); hover for career stats — goals, assists, caps, WC appearances, best WC finish, club.
- **Key Contributors** — curated playmakers (De Bruyne, Modrić, Foden, Pedri) with the same hover-stats pattern.
- **Country flag images** render everywhere a country code appears — hero, venue cards, match cards, group tables, history.
- **Finance analogue**: the same hover-for-detail pattern would surface deep stats on any analyst, portfolio, or instrument without cluttering the dashboard.

6. Architecture and operations

Hosting: Azure Static Web Apps (Free tier). Live URL above.

Refresh cadence: every 5 minutes via GitHub Actions scheduled workflow (cron `* /5 * * * *`). The pipeline fetches data, regenerates the HTML, and redeploys to Azure automatically.

Source control: GitHub (vineet2806/Fifa_World_Cup_2026) — every change goes through git, every deploy is auditable.

Secrets: Azure deployment token and Groq API key stored as GitHub Actions secrets, never in source code.

Self-contained output: the deployed page is a single HTML file with all CSS, JS, data, flag images, and the FIFA logo embedded — no external CDN dependencies.

7. Why this pattern fits an AI-in-Finance use case

The same pipeline — scheduled fetch → AI-augmented insight generation → static self-contained dashboard published behind enterprise SSO — is directly applicable to finance MIS, risk dashboards, treasury reports, or daily P&L summaries. The only changes for a real finance build would be: (1) swap public sports data for internal financial data, (2) deploy behind authentication, and (3) use a finance-tuned LLM prompt for the narrative layer.
